Skier triggered on Emigrant Peak

Emigrant Peak Out of Advisory Area 12/24/2018 Code HS-ASu-R3-D3-O Elevation 9800 Aspect N Latitude 45.26290 Longitude -110.70700 Notes From an email:

This was triggered Christmas Eve day while skinning up a ridge in the mountains east of Emigrant Peak. It broke about 8' back from the <u>cornice</u>/drift right near my ski tips. I instinctively did a quick drop and roll away even though it was unnecessary. Pretty pulse quickening. I didn't get great pictures as I was heading up the ridge and the light was bad. You can pick out the debris flow by its lighter shade of white and see chunks of <u>cornice/slab</u> that got hung up in the <u>starting zone</u>.

North Facing <u>aspect</u> at approx. 9800' on a west to east ridge.Slope angles are 35-40. Crown varied from 1-3'. Hard <u>slab</u> on the the <u>cornice</u> propagated to two other small starting zones and pulled the cornices and all the faceted snow near the ridgeline. Avalanche ran about 800'.

The last few week's weather has really weakened what was starting off to be a decent base. Now the winds have capped a a lot of zones with a hard <u>slab</u> pockets.
