Skier triggered avalanche in Beehive Basin

Beehive Basin Northern Madison 1/22/2019 Code SS-ASu-R2-D2-I Elevation 9000 Aspect NE Aspect Range ENE Latitude 45.34220 Longitude -111.39700 Notes

From an email:

"Dug a pit at ~9000' on a NE <u>aspect</u>, got a ECTP29 at 56cm down, breaking below the new snow and a 12cm knife-hard <u>slab</u>. Broke on small facets (<1mm) in between wind slabs. I marked the <u>trigger point</u> in red. Skinned up a low angle gully up to around 9500'. As I got near the steepest part of the gully (38°), a soft <u>slab</u> 12-18" thick propagated 100' wide and slid 500' back down to my pit. No one was caught. Contrary to my pit, this ENE <u>aspect</u> slid just the new snow on top of a previous <u>wind slab</u>. No facets on the <u>bed surface</u>, just new snow/old snow interface. Found safer skiing down low in the trees where there was less <u>wind loading</u>."
