Activity

Skiing

Snowboarding

I and one friend observed the remains of a natural avalanche below the north facing headwall up Flanders creek. It looked as if it happened within the past few days. I didn't get close enough to really gauge the size in width but it propagated at the ground. The crown looked to be 3'-4' deep. We tucked tail and ran after we saw this and didn't investigate further.

Region

Northern Gallatin

Location (from list)

Flanders Creek

Observer Name

Jared Chesbro
