

Cooke City, unstable snowpack

Date

Mon, 12/04/2023 - 16:05

Skied south of Cooke City today. LOTS of collapsing and cracking. (maybe 30 good collapses throughout the day) Felt confident that one could have easily triggered an avalanche today if they wanted to.

New snow: about 10cms more last night. Warmer temps, so the new snow was slightly upside down from the weekend's fresh snow.

ECTP2 on a west [aspect](#) at 9200'. [Snowpit](#) attached.

New/ old snow interface is the layer of primary concern. (persistent [slab](#) problem)

No avalanche activity observed.

Region

Cooke City

Observer Name

Beau Fredlund
