

Poor test score on divide peak

Date

Wed, 12/18/2024 - 12:45

Activity

Snowboarding

I toured to the East shoulder of divide park today

It was very windy and snow was being transported everywhere.....especially on the high peaks

I dug a pit on the SE shoulder of divide at around 9600' and got a ECTP 14 on the persistent weak created during the long dry spell layer buried from this weeks storms. 50cm of snow had fallen up high in the main fork of hyalite since Sunday night. Total snow depth is 115 cm

Region

Northern Gallatin

Location (from list)

Divide Peak
