

large natural avalanche, NE Mt. Henderson

Date

Mon, 12/30/2024 - 14:00

Activity

Skiing

We were ski touring on the SW side of Mt. Henderson today, and noticed a large (natural?) avalanche on the NE [aspect](#) of Henderson. First observed at around 1:15pm. It appeared to be very fresh, possibly from a [remote trigger](#) this morning.

2 photos attached. A NE [aspect](#), around 10,000'.

It looked to be 4-6' deep and about 500' wide. And it failed on snow at/ near the ground.

Weather: today alternated between heavy snowfall, and patches of sunshine. Temps in the low/ mid 20's F, and calm winds. A very nice day for ski touring.

No other avalanche activity observed in Miller Creek.

We experienced a couple of large collapses on westerly aspects/ in wind affected terrain around 10,000'.

Region

Cooke City

Location (from list)

Henderson Mountain

Observer Name

Beau Fredlund
